Abstract

This is the canonical abstract. Replace it with the manuscript abstract. It is shared across all journal builds unless a journal-specific override exists at `variants/<journal>/abstract.tex`.

Keywords: computational neuroscience; reproducibility; manuscript preparation

1 Introduction

The introduction motivates the work and states the contribution. Cite with `biblatex`, e.g. a foundational result [1]. Section content lives in its own file under `sections/` so it can be reordered or overridden per journal.

2 Results

Results go here. Refer to figures, tables, equations and other sections with `cleveref`, e.g. Section 4 describes the procedure, Fig. 1 shows the response, Table 1 summarizes the parameters, and the model is given by Eq. (1).

The membrane potential V evolves according to a leaky integrator,

$$\tau \frac{dV}{dt} = -(V - V_{\text{rest}}) + RI(t), \quad (1)$$

with membrane time constant τ , resting potential V_{rest} , input resistance R , and input current $I(t)$. For an unnumbered display, use `\[ ... \]` or the `equation*` environment.

Table 1. Example parameters. A `booktabs` table; its caption also uses the `caption` package at `small` font. Table captions go *above* the tabular by convention.

Parameter	Symbol	Value
Membrane time constant	τ	20 ms
Resting potential	V_{rest}	−65 mV
Input resistance	R	100 MΩ

3 Discussion

The discussion interprets the results and situates them in the literature.

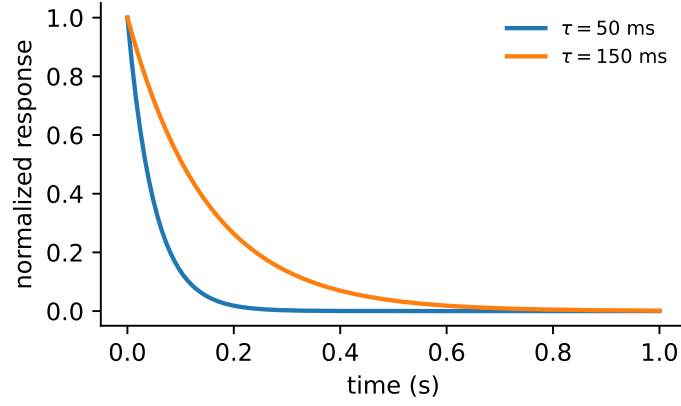

Figure 1. Example figure. Normalized response of Eq. (1) to a step input for two membrane time constants. Replace `figures/example-figure.pdf` with your own (regenerate via `scripts/make-example-figure.py`). Captions use the `caption` package at small font.

4 Methods

Methods describe the procedure in enough detail to reproduce it.
